

Get rid of Floating Identity Islands!

QuickLaunch Cloud Identity Provider

Are your user identities for multiple IT applications floating like islands? That's a huge red flag from an ITSecurity standpoint. It's time to secure your user-identities in a more evolved manner as against legacy models such as On-Premise Active Directory or worse, Open Source Identity Providers. Your user identity information deserves way more importance and security under a trusted source.

QuickLaunch Identity Provider is a cloud-based, self-service identity provider which supports various protocols including SAML 2.0, CAS, WS-Federation, Open AM and Open ID to achieve single authentication across all the backend systems. QuickLaunch IDP comes with a built-in, highly-available identity provider eliminating the need of having an onsite Shibboleth or CAS environment.
